Course Name: Web Application Design	Teacher's Name: Marco Horacion Moreno Gonzales
Module: 3	Evidence: 3
Date: 05/04/2026	

Project Description:

The project aims to solve the need for an internal administration system for orders and users. Regarding order management, it allows listing and searching orders using filters such as invoice number, customer number, date, and status, as well as displaying key information for each order and creating new records. It also incorporates a control system for deleted orders through logical deletion, which makes it possible to maintain a separate record of deactivated orders without losing their historical information and to consult them easily. On the other hand, in user administration, the system restricts user creation and role assignment exclusively to the administrator, allowing the registration of internal users by department with username, password, and role, listing existing users with their role, active status, and ID, as well as changing user roles and saving the changes. Overall, the project resolves the need for role-based access control, order search and filtering, and logical deletion handling to avoid losing the history of deactivated orders.

The development was structured into three main phases. In the first phase, a web application was built with essential functionalities: an authentication module (login) to control access, a form to enter data into the database, and an interface to list and display the stored records. In the second phase, errors or inconsistencies that prevented the correct operation of the system were identified and resolved, ensuring that the login, data entry, and display worked smoothly and without failures. Finally, in the third phase, we found a free cloud server and chose it because it had good reviews; on this new environment, all the code was adapted to be compatible with the server's infrastructure, the remote database was created and configured, the necessary credentials were connected, and the fully functional application was deployed.

Work Team:

- Iker Deras Jimenez
